

The level of ego strength and its relationship to the level of psycho-social adjustment among a sample of wives of martyrs in the province of Damascus

Dr. Raghda Neiseh

Abstract

The research aims to identify the level of ego strength among the members of the research sample of wives of martyrs and the level of social-psychological agreement among the members of the social psychological research sample of wives of martyrs. The research defines the relationship between the level of ego strength and psycho-social adjustment among members of the psycho-social research sample of wives of martyrs. Intimate illustrate the differences in the subjects' responses on a scale ego strength and scale a of psychosocial adjustment variables according to the research: (the number of years, lost a spouse, educational level). The researcher relied on the descriptive analytical method, also used the two tools of the research Search: (a measure of the power of the ego, and psychosocial adjustment scale). The research sample consisted of (420) wife martyrs in the province of Damascus. The most important findings of the research:

For the paper in Arabic see pages (323-372)
